#### Fertility factor (demography) - Wikipedia

If you 've heard it once, you 've heard it a million times: the most important factor in fertility is age. Women are born with all the eggs they 'll ever have, and as we age, the quantity and the quality of those eggs both decline.

---

#### The top 6 factors that affect a woman 's fertility

This can damage the ovaries or fallopian tubes and cause fertility problems. Pelvic inflammatory disease. Pelvic inflammatory disease (PID) is an infection of the upper female genital tract, which includes the womb, fallopian tubes and ovaries. It's often caused by a sexually transmitted infection (STI). PID can damage and scar the fallopian tubes, making it virtually impossible for an egg to travel down into the womb.

#### causes of infertility - NHS - NHS

Fertility and hatchability are two major parameters that highly influence the supply of day-old chicks. Fertility refers to the percentage of incubated eggs that are fertile while hatchability is the percentage of fertile eggs that hatch. It is, therefore, important to understand the factors that influence fertility and hatchability of eggs.

Population - Biological factors affecting human fertility ...

Peritoneal factor infertility refers to abnormalities involving the peritoneum (the membrane that lines the inside of your abdomen) such as scar tissues (adhesions) or endometriosis. Endometriosis is a condition where tissue that normally lines the uterus begins to grow outside the uterus.

This detailed examination of recent trends in fertility and mortality considers the links between those trends and the socioeconomic changes occurring during the same period.

This overview includes chapters on child mortality, adult mortality, fertility, proximate determinants, marriage, internal migration, international migration, and the demographic impact of AIDS.

Fertility rates and population growth influence economic development. The marked declines in fertility seen in some developing nations have been accompanied by slowing population growth, which in turn provided a window of opportunity for rapid economic growth. For many sub-Saharan African nations, this window has not yet opened because fertility rates have not declined as rapidly there as elsewhere. Fertility rates in many sub-Saharan African countries are high: the total rate for the region is estimated to be 5.1 births per woman, and rates that had begun to decline in many countries in the region have stalled. High rates of fertility in these countries are likely to contribute to continued rapid population growth: the United Nations projects that the region's population will increase by 1.2 billion by 2050, the highest growth among the regions for which there are projections. In June 2015, the Committee on Population organized a workshop to explore fertility trends and the factors that have influenced them. The workshop committee was asked to explore history and trends related to fertility, proximate determinants and other influences, the status and impact of family planning programs, and prospects for further reducing fertility rates. This study will help donors, researchers, and policy makers better understand the factors that may explain the slow pace of fertility decline in this region, and develop methods to improve family planning in sub-Saharan Africa.
