The story about how a skeptical doctor discovered evidence on past lives and developed a method using them to cure his patients. There are many stories about how a skeptic turns into a believer but this one stands out. A skeptical doctor was astonished when he discovered one of his patients recalling past-life traumas. Those wounds from the past seem to be responsible of his recurring nightmares and anxiety attacks. Doctor Weiss manages to channel his new knowledge and develop a method called "past life regression" which recovers memories of incarnations in order to address them and cure the patient of his traumas. (Note: This summary is wholly written and published by Abbey Beathan. It is not affiliated with the original author in any way) "For truly we are all angels temporarily hiding as humans." - Brian L. Weiss After discovering about past lives, Brian L. Weiss entered a new phase in his career; one that would use memories from the past lives of patients in order to heal them. His method of hypnosis worked so he started heading in a new path in order to help each one of his patients. His work in parapsychology is outstanding and his method of past life regressions is brilliant. Definitely a book worth reading. A skeptic doctor discovered evidence that baffled him and change his mind about reincarnation. P.S. Multidimensional scaling (MDS) is a technique for the analysis of similarity or dissimilarity data on a set of objects. Such data may be intercorrelations of test items, ratings of similarity on political candidates, or trade indices for a set of countries. MDS attempts to model such data as distances among points in a geometric space. The main reason for doing this is that one wants a graphical display of the structure of the data, one that is much easier to understand than an array of numbers and, moreover, one that displays the essential information in the data, smoothing out noise. There are numerous varieties of MDS. Some facets for distinguishing among them are the particular type of geometry into which one wants to map the data, the mapping function, the algorithms used to find an optimal data representation, the treatment of statistical error in the models, or the possibility to represent not just one but several similarity matrices at the same time. Other facets relate to the different purposes for which MDS has been used, to various ways of looking at or "interpreting" an MDS representation, or to differences in the data required for the particular models. In this book, we give a fairly comprehensive presentation of MDS. For the reader with applied interests only, the first six chapters of Part I should be sufficient. They explain the basic notions of ordinary MDS, with an emphasis on how MDS can be helpful in answering substantive questions.

Most textbooks on neurodegenerative disorders have used a classification scheme based upon either clinical syndromes or anatomical distribution of the pathology. In contrast, this book looks to the future and uses a classification based upon molecular mechanisms, rather than clinical or anatomical

boundaries. Major advances in molecular genetics and the application of biochemical and immunocytochemical techniques to neurodegenerative disorders have generated this new approach. Throughout most of the current volume, diseases are clustered according to the proteins that accumulate within cells (e.g. tau, α -synuclein and TDP-43) and in the extracellular compartments (e.g. β -amyloid and prion proteins) or according to a shared pathogenetic mechanism, such as trinucleotide repeats, that are a feature of specific genetic disorders. Chapters throughout the book conform to a standard lay-out for ease of access by the reader and are written by a panel of International Experts Since the first edition of this book, major advances have been made in the discovery of common molecular mechanisms between many neurodegenerative diseases most notably in the frontotemporal lobar degenerations (FTLD) and motor neuron disease or amyotrophic lateral sclerosis. This book will be essential reading for clinicians, neuropathologists and basic neuroscientists who require the firm up-to-date knowledge of mechanisms, diagnostic pathology and genetics of Neurodegenerative diseases that is required for progress in therapy and management.
