The Beal Conjecture A Proof
The conjecture was formulated in 1993 by Andrew Beal, a banker and amateur mathematician, while investigating generalizations of Fermat's last theorem. Since 1997, Beal has offered a monetary prize for a peer-reviewed proof of this conjecture or a counterexample. The value of the prize has increased several times and is currently \$1 million.

Beal conjecture - Wikipedia
BEAL'S CONJECTURE: If $A^x + B^y = C^z$, where A, B, C, x, y and z are positive integers and x, y and z are all greater than 2, then A, B and C must have a common prime factor. In the fall of 1994, Andy Beal wrote letters about his work to approximately 50 scholarly mathematics periodicals and number theorists.

The proof of Pythagoras theorem is given by Euclidean geometry's original 47th proposition. Inspired by this, the author found an effective way to prove the Beal conjecture.

The conjecture and prize was announced in the December 1997 issue of the Notices of the American Mathematical Society. Since that time Andy Beal has increased the amount of the prize for his conjecture.

Beal's Conjecture Revisited¶

In 1637, Pierre de Fermat wrote in the margin of a book that he had a proof of his famous "Last Theorem":

If $A^n + B^n = C^n$, where A, B, C, n are positive integers then $n \leq 2$.

Centuries passed before Andrew Beal, a businessman and amateur mathematician, made his conjecture in 1993:

If $A^x + B^y = C^z$,
